**AUTOMATIC TENSIONER SYSTEM** 

The track tensioning system is a hydraulic cylinder directly connected to and controlled by the main hydraulic system.

The system creates zero maintenance because it ensures the constant and correct tensioning of the track itself.

The SPS system is what allows theuse of the Billennium Spiderbooms even without lowering the stabilizers, levelling longitudinally up to a maximum of 10° with a maximum working height of 9 m (max lateral slope 5°).

This is made possible by the seamless technological mix of proactive and dynamic levelling, the XXL undercarriage and an automatic hydraulic longitudinal levelling of the basket.

This system calculates the stabilization area in real time by measuring the angle of descend of each individual stabiliser in order to optimise the operational outreach performance over the entire working area up to an extra 0.5 m.
